1 Potpourri [30 points]

Initials: Solutions

1.1 Microarchitecture or ISA? [10 points]

Based on your knowledge of a basic MIPS design and the computer architecture techniques you learned throughout this course, put an "X" in the box corresponding to whether each of the following design characteristics is *better* classified as "microarchitecture" or "ISA":

| Characteristic | Microarchitecture | ISA |
|--|-------------------|-----|
| General purpose register \$29 is the stack pointer | | X |
| Maximum bandwidth between the L2 and the L3 cache | X | |
| Maximum reservation station capacity | X | |
| Hardware floating point exception support | | X |
| Instruction issue width | X | |
| Vector instruction support | | X |
| Memory-mapped I/O Port Address | | X |
| Arithmetic and Logic Unit (ALU) critical path | X | |
| CPU endianness | | X |
| Virtual page size | | X |

1.2 Single-Cycle Processor Datapath [10 points]

Modify the single-cycle processor datapath to include a version of the 1w instruction, called 1w2, that adds two registers to obtain the effective address. The datapath that you will modify is provided below. Your job is to implement the necessary data and control signals to support the new 1w2 instruction, which we define to have the following semantics:

```
1w2: Rd \leftarrow Memory[Rs + Rt]
 PC \leftarrow PC + 4
```

Add to the datapath any necessary data and control signals (if necessary) to implement the 1w2 instruction. Draw and label all components and wires very clearly (give control signals meaningful names; if selecting a subset of bits from many, specify exactly which bits are selected; and so on).

| ALU opcode | Operation |
|------------|---------------------|
| 00 | Add |
| 01 | Subtract |
| 10 | Controlled by funct |
| 11 | Not used |

There is no need for new components and wires. The main difference is that the ALU must use "Read data 2", instead of the output of the sign extend unit. The new 1w2 will be R-type, not I-type. The values of the control signals need to be:

 $\begin{array}{l} {\rm RegDst}=1;\\ {\rm ALUScr}=0;\\ {\rm MemtoReg}=1;\\ {\rm RegWrite}=1;\\ {\rm MemRead}=1;\\ {\rm MemWrite}=0;\\ {\rm ALUop}=00;\\ {\rm Branch}=0. \end{array}$

1.3 Performance Evaluation [10 points]

The execution time of a given benchmark is 100~ms on a 500~MHz processor. An ETH alumnus, designing the next generation of the processor, notices that a new implementation enables the processor to run at 750~MHz. However, the modifications increase the CPI by 20% for the same benchmark.

(a) [4 points] What is the execution time expressed in terms of the number of cycles taken for the **old** generation of the processor (i.e., before the modifications)?

Assuming that the IPC is 2, what is the number of instructions in the benchmark?

Answer: Execution time is 50 Million cycles. The benchmark has 100 Million instructions.

Explanation:

Initials: Solutions

Clock frequency is 500 MHz. Then each cycle takes $1/(500 \times 10^{-6}) = 2ns$. Total execution time in cycles is 100ms/2ns = 50Million cycles.

2 instructions per cycle. Then, the total number of instructions: 2x50M = 100M

(b) [3 points] What is the execution time of the benchmark in *milliseconds* for the **new** generation of the processor?

Answer: 80 ms.

Explanation:

Execution $Time = [Number \ of \ Instructions] \times [CPI] \times [Frequency^{-1}]$ Let's say that the CPI of baseline is c, and number of instructions is i.

Then the execution time of baseline:

```
(c \times i)/(500x10^6) = 100x10^{-3} \ seconds => (c \times i) = 5 \times 10^7
```

The execution time after modifications: $((1.2 \times c) \times i)/(750x10^6)$

 $T = ((1.2 \times (c \times i))/(750 \times 10^6) \text{ seconds.}$

 $T = ((1.2 \times (5 \times 10^7))/(750 \times 10^6) \text{ seconds.}$

 $T = 8 \times 10^{-2} = 80 ms.$

(c) [3 points] What is the speedup or slowdown of the new generation processor over the old generation?

```
Answer: 25% speedup
```

Explanation:

```
Speedup = (OldExecutionTime / [NewExecutionTime]) - 1
```

Speedup = 100/80 - 1

 $Speedup\ = 0.25$

Then the modification introduces 25% speedup.
